2009-2010 ELA and Math Effect Sizes for All Authorized Charter Schools

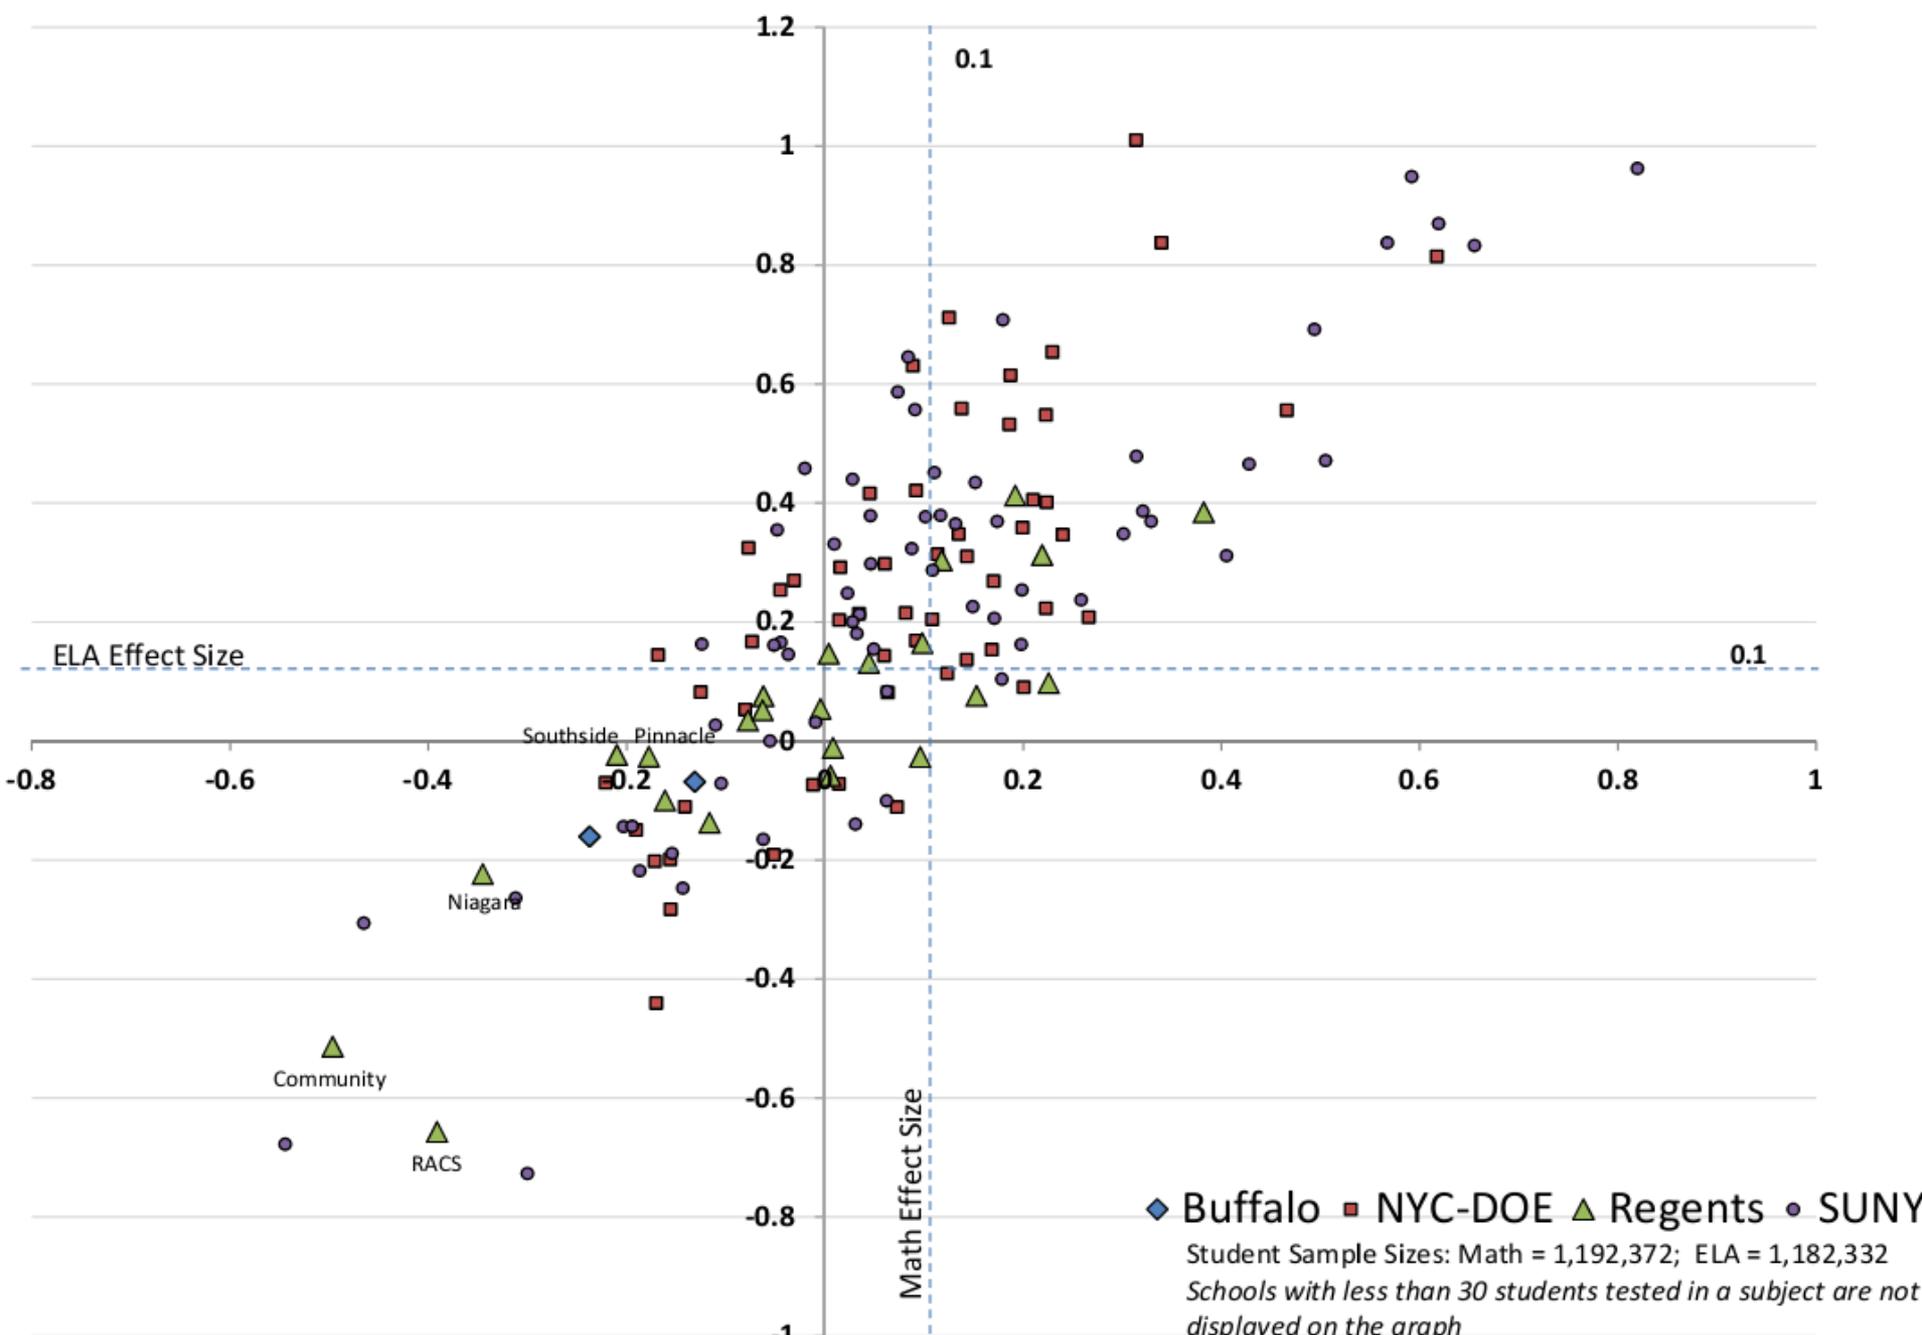

All charter schools with students assessed in grades 3-8 are included in this regression model. Schools were compared by controlling for poverty, students with disabilities, and English language learners at every grade level and among schools of the same grade span. Effect sizes were determined by dividing the difference between the predicted and actual performance of the school by the standard deviation. This was calculated by grade level and then aggregated and compared to the school's predicted performance, the difference of which is expressed as an effect size.
